

FEATURES AND BENEFITS OF COMPROMISE ASSESSMENT

WHAT IS A COMPROMISE ASSESSMENT?

A compromise assessment uses the same tools as incident response in order to look for indicators that an organization has been compromised. The assessment includes the review of logs from a sampling of key devices, such as firewalls, IDS/IPS, critical servers, and a subset of workstations. Foresite leverages both technical tools and investigative skills based on years of cybersecurity experience.

WE LOOK FOR:

- Malware variants
- Persistence mechanisms
- Signs of lateral movement
- Anomalous behavior(s) that could be indicative of malware or attacks

WHAT IS THE VALUE TO YOUR CLIENTS?

- Unique offerings that helps clients gain a new level of visibility into their networks.
- Identification of undetected threats allows those threats to be properly addressed, and damage can be mitigated as quickly as possible.
- Peace of mind for clients who “don’t know what they don’t know” about what is happening in their environment.
- An added layer of detection and defense to protect critical data, minimize financial exposure, and curtail reputational damage from a breach – especially a breach that goes undetected for months.
