

NETWORK MONITORING VS NETWORK SECURITY MONITORING

NETWORK MONITORING

NETWORK SECURITY MONITORING

Understand the health and status of an organization's network.	WHAT IT IS	The process of monitoring network devices and their traffic to identify threats, anomalous behaviors and vulnerabilities that may be used to exploit the network.
Tracks network activity to detect issues caused by malfunctioning devices or overloaded resources.	WHAT IT DOES	Analyzes network information to prevent potential attacks by identifying and mitigating threats.
Provides data collection and analysis of basic traffic flows, availability, performance, and configuration.	HOW IT WORKS	Collects, examines, and investigates network activity, traffic patterns, and other log data looking for anomalies and other potential security threats.
Gives proactive alerts to network administrators and help organizations avoid downtime caused by major system failures.	WHY YOU NEED IT	Protects organizations from potential vulnerabilities, threats, and exploits and uses automation for rapid detection and response
